Stock market confidence indices
April 2023
Bulletin No. 30

FEDESARROLLO
Centro de Investigación Económica y Social

In April, the **One-Year Confidence Index** stood at 84.0%, up 10.7 pps from the previous month and 6.6 pps from the same month of 2022. This indicates that the proportion of analysts forecasting a COLCAP valuation within one year increased versus the previous month and the previous year.

The **Buy-on-Dips Confidence Index** reached 52.6%, representing an increase of 11.7 pps versus the previous month and a decrease of 8.2 pps versus the same month in 2022. This implies that analysts consider a rise in the MSCI COLCAP more likely the day after a potential drop in the index compared to March 2023 and less likely compared to April 2022.

The **Crash Confidence Index** stood at 60.0%, up 22.5 pps versus the previous month and stable versus the same month in 2022. This indicates that analysts consider the market less vulnerable to downturns in international markets compared to the previous month and equally vulnerable compared to a year ago.

Finally, the **Valuation Confidence Index** stood at 97.6%, up 1.8 pps from the previous month's level and up 11.3 pps from the same month in 2022. This implies that a higher proportion of analysts believe that equity values underestimate the value of their fundamentals ahead of March 2023 and of April 2022.

MSCI COLCAP Index

The Colombian MSCI COLCAP Index is a market-capitalization weighted index that includes the most liquid stocks listed in the BVC (Bolsa de Valores de Colombia). This index represents one of the most important leading indexes in the stock market. The average so far in April 2023 (up to April 17) is at 1,257.06, which represents a 5.2% appreciation with respect to the average for March 2023 (1,158.11) and a 24.4% devaluation with respect to the average for April 2022 (1,610.51).

At the end of March, the MSCI COLCAP stood at 1,158.11, which corresponds to 44.4 units below analysts' forecast (1,202.5). By the end of April, the index is expected to be in a range between 1,200 and 1,265.0, with a median response of 1,210.0 (Graph 1).

The four confidence indices for the Colombian stock market are presented down below. These indices are calculated based on the Shiller (2000) methodology and using the analysts' expectations collected in the Financial Opinion Survey.

One-Year Confidence Index[1]

The One-Year Confidence Index measures the proportion of analysts expecting an increase in the MSCI COLCAP in the coming year. In this edition, the index stood at 84.0%, indicating that this percentage of respondents expects an increase in the index in April 2024 from the current level (1,193.57) (Graph 2). The index experienced an increase of 10.7 pps versus the previous month (73.3%) and 6.6 pps versus the same month of the previous year (77.4%), reflecting a monthly and annual increase in stock market confidence.

---

[1] The One-Year Confidence Index is calculated as the number of respondents that establish a price for the MSCI COLCAP index in 12-months higher than the current level of the index, divided by the total responses excluding invalid answers.

Buy-on-Dips Confidence Index[2]

The Buy-on-Dips Confidence Index establishes the proportion of the analysts expecting a rebound the next day that the market hypothetically dropped 3%. The index increased in April 2023 compared to March of the same year, standing at 52.6%. Specifically, it presented an increase of 11.7 pps compared to last month (40.9%) (Graph 3). Also, analysts consider an immediate recovery of COLCAP more likely compared to the 2022 average (45.3%).

---

[2] The Buy-on-Dips Confidence Index is calculated as the number of respondents who expect an increase in the MSCI COLCAP index the next day after a 3% drop, divided by the total answers excluding the "no opinion" option.

Crash Confidence Index[3]

The Crash Confidence Index shows the proportion of analysts who attach little probability to a stock market crash in the next six months after a substantial drop in the international markets. In April, the index increased 22.5 pps with respect to the previous month's result (37.5%), reaching 60.0%, indicating that the perception of the probability of an eventual fall of the local stock market in the face of the deterioration of international markets decreased compared to March (Graph 4). In addition, the index was at the same level for the same month of the previous year.

---

[3] The Crash Confidence Index is calculated as the number of responses who attach a probability between 0% and 25% to a stock market crash in the next six months including the case that a crash occurred in the international markets and spreads to Colombia, divided by the total responses excluding the "does not apply" option.

Valuation Confidence Index[4]

The Valuation Confidence Index is the proportion of analysts who think that the market is not too highly valued compared with measures of true fundamental value. For April, the index stood at 97.6%, which is 1.8 pps above the March level (95.8%) and 11.3 pps above April 2022 (86.4%). This indicates that, compared to the previous month and compared to the same month last year, a higher proportion of analysts believe that the value of stocks underestimates the value of their fundamentals (Graph 5).

[4] The Valuation Confidence Index is calculated as:
$Valuation\ Confidence\ Index = \big(1 * (\%\ too\ low)\big) + \big(0.5 * (\%\ about\ right)\big)$, where % too low and % about right, correspond respectively to the number of analysts who chose that the values of the local stocks are too low and about right in regard of the fundamental value excluding the option "do not know".
